Disclosure of Conflicts of Interest

I, Ailsa Hart, herewith declare the following paid or unpaid consultancies, business interests or sources of honoraria payments for the past three years, and anything else which could potentially be viewed as a conflict of interest:

I report serving as a lecturer and/or on an advisory board for Bristol Myers Squibb, Celltrion, Falk, AbbVie, Johnson & Johnson, Takeda, Pfizer, Galapagos, MSD, and GSK.

©Speaker: Ailsa Hart

at ECCO'25 Congress

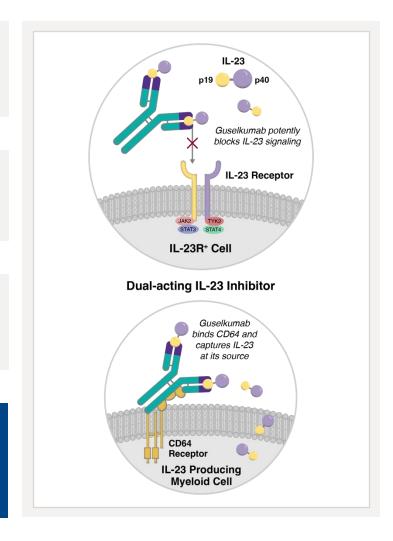

Background and Objective

Guselkumab is a dual-acting IL-23p19 subunit inhibitor that potently blocks IL-23 and binds to CD64, a receptor on immune cells that produce IL-23¹

In GALAXI, IV induction with guselkumab was effective and safe in participants with moderately to severely active Crohn's disease²

Flexibility in the route of administration of induction therapy (IV or SC) may be preferred by patients and healthcare providers

Study Objective: The GRAVITI study (NCT05197049) evaluated the efficacy and safety of guselkumab SC induction and maintenance in participants with moderately to severely active Crohn's disease

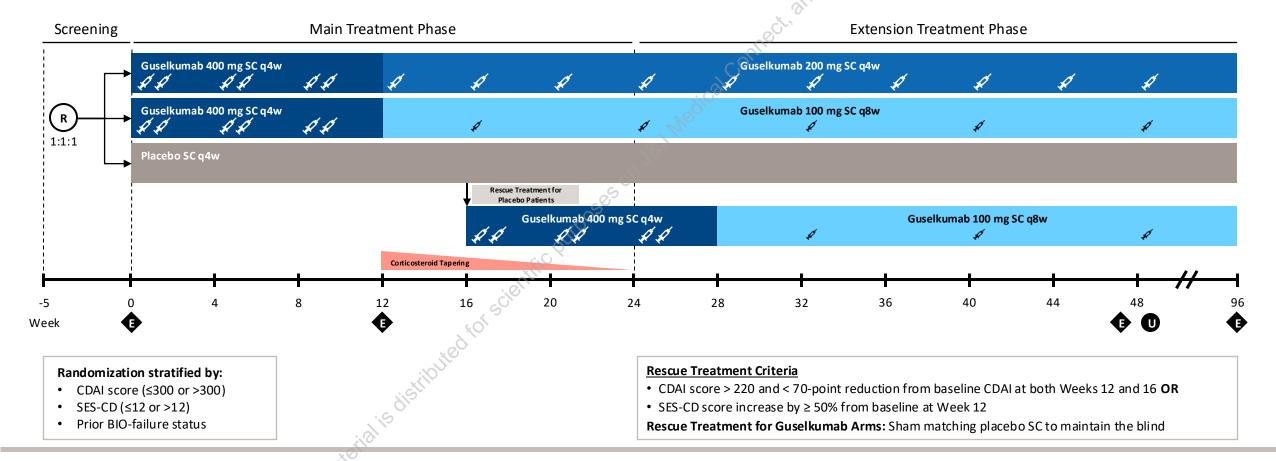

- 1. Atreya R, Abreu MT, Krueger JG, et al. J Crohns Colitis. 2024;18(suppl):S470.
- 2. Panaccione R, Danese S, Feagan BG, et al. Gastroenterology. 2024; 166(5): S1057b.

Phase 3, Double-blind, Treat-through Design: GRAVITI

Key Eligibility Criteria:

- Moderately to severely active CD (CDAI score 220–450 AND either mean daily SF count ≥4 OR AP score ≥2) and SES-CD score ≥6 (or ≥4 for isolated ileal disease)
- Inadequate response/intolerance to oral corticosteroids, 6-MP/AZA/MTX, or biologic therapies^a

Endpoints and Statistical Considerations

Endpoints

Co-primary endpoints

- Clinical remission at Week 12
- Endoscopic response at Week 12

Additional multiplicity-controlled endpoints

- PRO-2 remission at Week 12
- Clinical response at Week 12
- Clinical remission at Week 24
- Clinical remission at Week 48
- Endoscopic response at Week 48

Other prespecified endpoints

- Endoscopic remission at Week 48
- Deep remission at Week 48

Statistical considerations

- Participants meeting prespecified treatment failure rules or had missing data were considered not to have met the endpoint
- Participants in all treatment groups (placebo or guselkumab) who met rescue criteria were considered not to have met endpoints after Week 16
- Endpoints assessed through Week 12 compared the combined guselkumab 400 mg SC treatment arm to placebo; assessments after Week 12 compared each guselkumab SC maintenance regimen to placebo^a

^a The confidence intervals for the proportion of participants meeting the endpoint in each treatment group were based on the normal approximation confidence limits. The adjusted treatment difference(s), confidence interval(s), and p-value(s) were based on the common risk difference by use of Mantel-Haenszel stratum weights and the Sato variance estimator. The stratification factors are baseline CDAI score (≤300 or >300), baseline SES-CD score (≤12 or >12), and BIO-failure status at baseline (yes or no).

Baseline Demographics and Disease Characteristics

	Guselkumab			
Primary analysis set	Placebo (N=117)	400 mg SC q4w → 100 mg SC q8w (N=115)	400 mg SC q4w → 200 mg SC q4w (N=115)	Total (N=347)
Demographics		anec.

CDAI= Crohn's disease activity index. CRP= C-reactive protein. IQR= interquartile range. SC= subcutaneous. SD= standard deviation. SES-CD= simple endoscopic score for Crohn's disease. ^a Based on N=117 for placebo, N=115 for guselkumab 400 mg q4w \rightarrow 100 mg SC q8w, N=114 for guselkumab 400 mg \rightarrow 200 mg SC q4w, and N=346 for total.

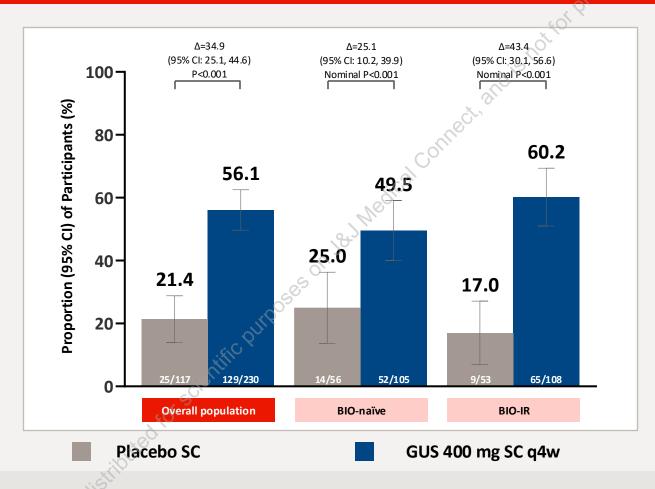

Baseline CD Medication History and Concomitant Medications

	Guselkumab				
Primary analysis set	Placebo (N=117)	400 mg SC q4w → 100 mg SC q8w (N=115)	400 mg SC q4w → 200 mg SC q4w (N=115)	Total (N=347)	
Medication history		alle			
No history of inadequate response/intolerance a to biologic therapy, $n\left(\%\right)$	64 (54.7%)	60 (52.2%)	62 (53.9%)	186 (53.6%)	
Biologic naïve	56 (87.5%)	53 (88.3%)	52 (83.9%)	161 (86.6%)	
Biologic experienced, but no documented nonresponse/intolerance	8 (12.5%)	7 (11.7%)	10 (16.1%)	25 (13.4%)	
History of inadequate response/intolerance to biologic therapy, n (%)	53 (45.3%)	55 (47.8%)	53 (46.1%)	161 (46.4%)	
At least one anti-TNF	50 (94.3%)	51 (92.7%)	52 (98.1%)	153 (95.0%)	
Two or more anti-TNFs	11 (20.8%)	12 (21.8%)	13 (24.5%)	36 (22.4%)	
Vedolizumab	8 (15.1%)	13 (23.6%)	6 (11.3%)	27 (16.8%)	
Concomitant Medications					
Participants with ≥1 CD medication at baseline, n (%)	79 (67.5%)	74 (64.3%)	84 (73.0%)	237 (68.3%)	
6-mercaptopurine/Azathioprine/Methotrexate	33 (28.2%)	29 (25.2%)	37 (32.2%)	99 (28.5%)	
Oral corticosteroids	33 (28.2%)	32 (27.8%)	38 (33.0%)	103 (29.7%)	

CD= Crohn's disease. SC= subcutaneous. TNF= tumor necrosis factor.

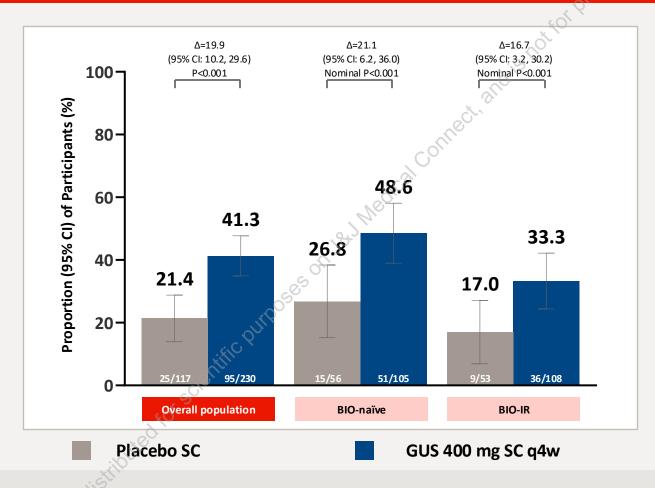

a Primary nonresponse, secondary nonresponse, or intolerance.

Clinical Remission at Week 12

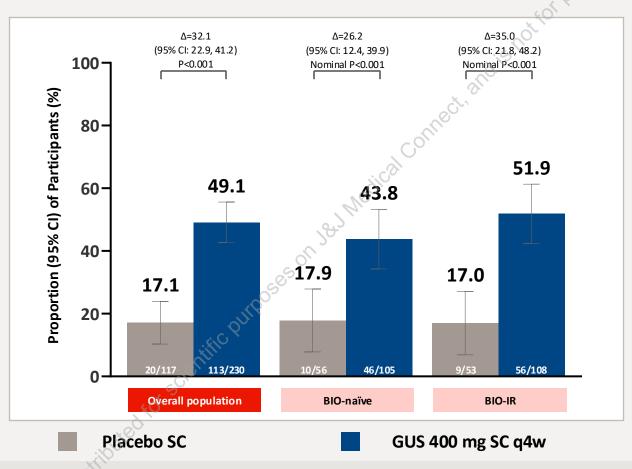

Clinical remission: CDAI score <150

Endoscopic Response at Week 12

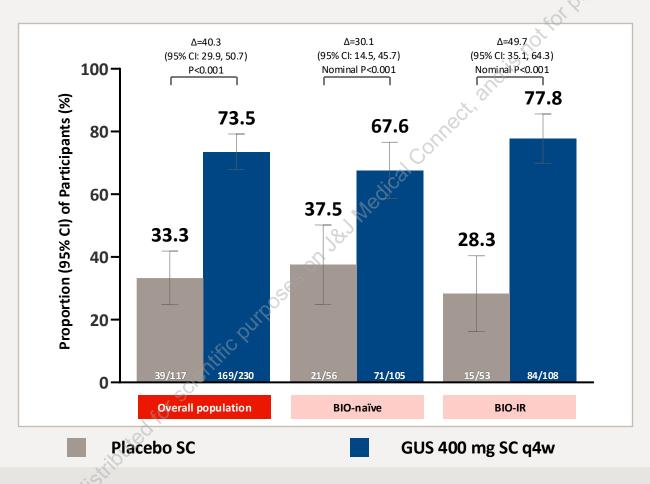

Endoscopic response: ≥50% improvement from baseline in SES-CD score

PRO-2 Remission at Week 12

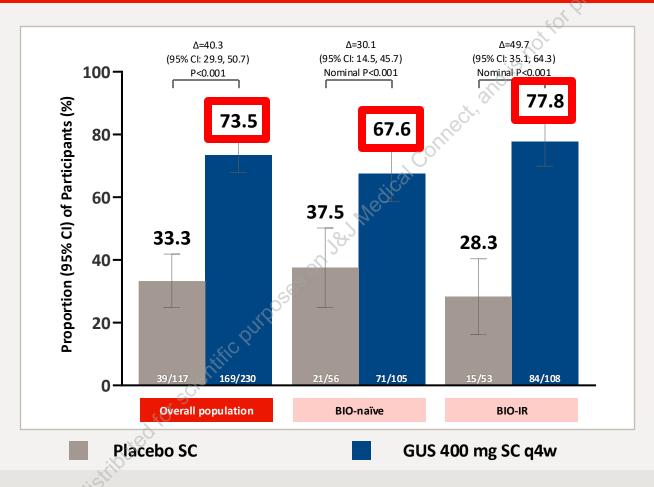

PRO-2 remission: Abdominal pain average daily score ≤1 and stool frequency average daily score ≤3, and no worsening of abdominal pain or stoolfrequency from baseline

Clinical Response at Week 12

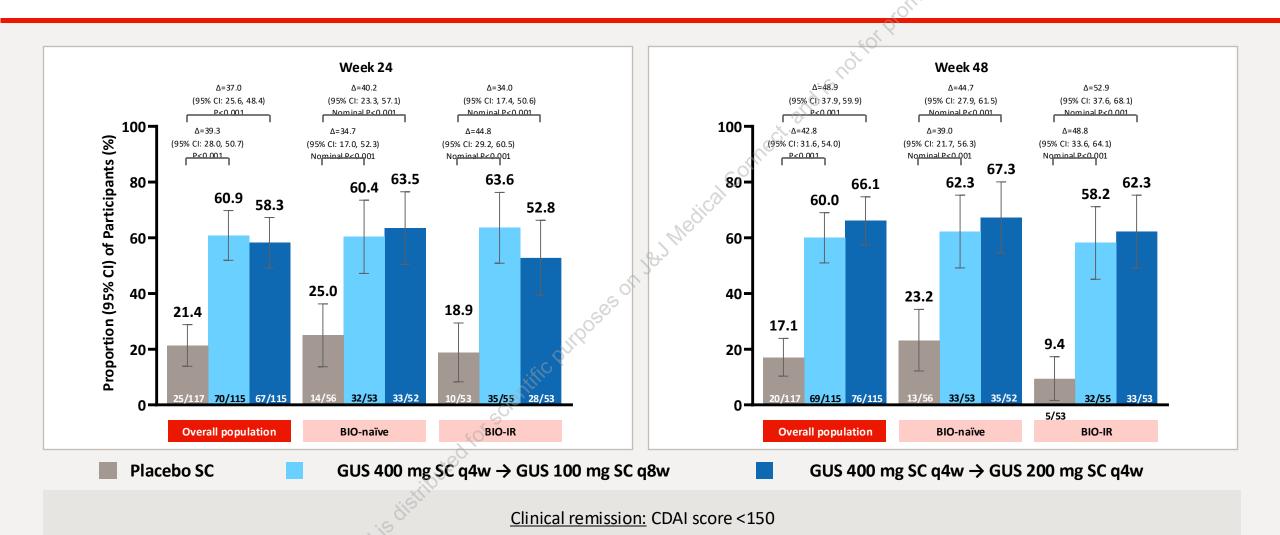

Clinical response: ≥100-point reduction from baseline in CDAI score or CDAI score <150

Clinical Response at Week 12

Clinical response: ≥100-point reduction from baseline in CDAI score or CDAI score <150

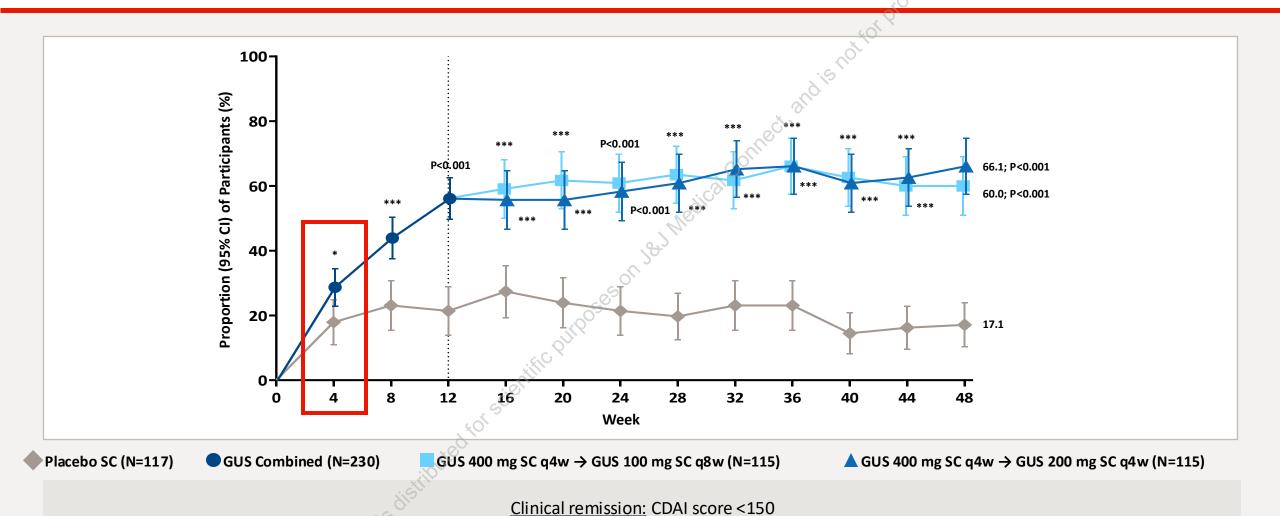

Clinical Remission at Weeks 24 and 48

BIO-IR = history of inadequate response or intolerance to previous biologic therapy.

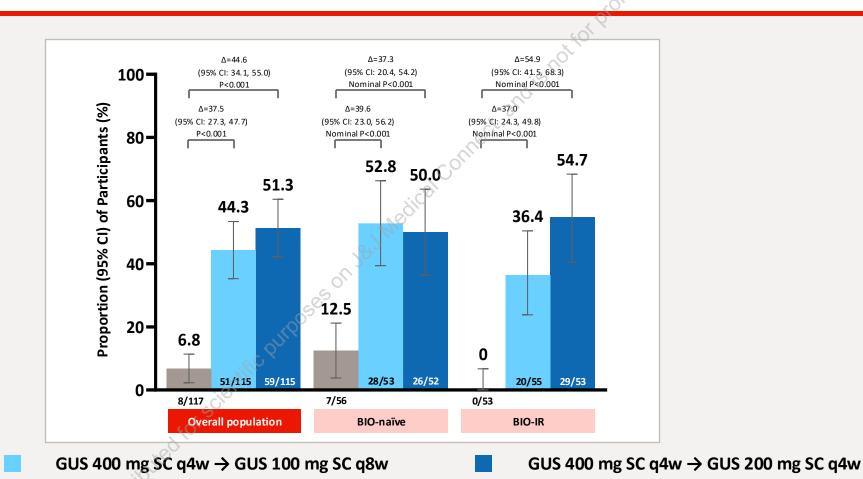

Note: Clinical remission at Weeks 24 and 48 were multiplicity-controlled for the overall population, not the BIO-naïve and BIO-IR subpopulations.

Clinical Remission Through Week 48

^{*} Nominal P<0.05. *** Nominal P<0.001.

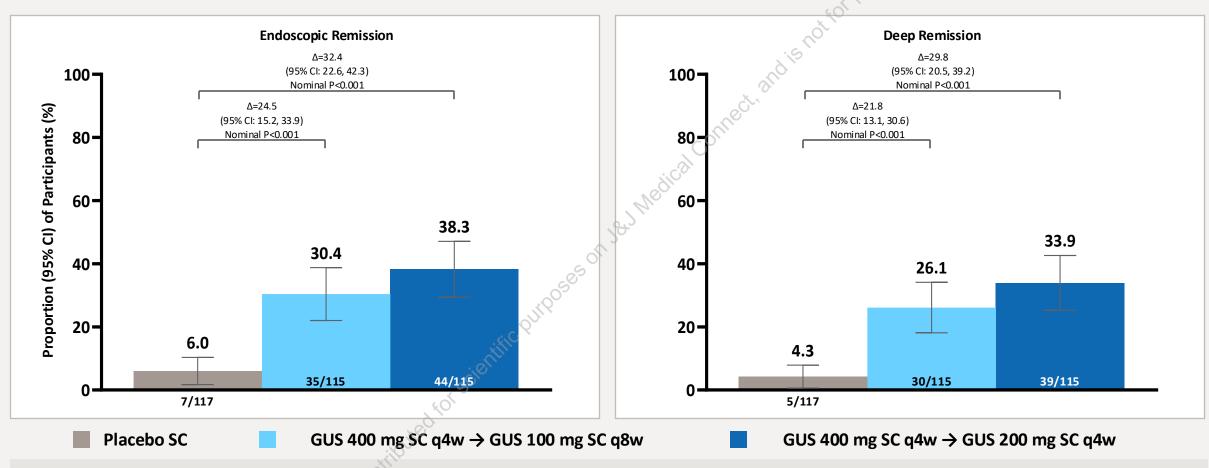

Endoscopic Response at Week 48

Endoscopic response: ≥50% improvement from baseline in SES-CD score

Placebo SC

Endoscopic Remission and Deep Remission at Week 48

Endoscopic remission: SES-CD score ≤4 and at least a 2-point reduction from baseline and no subscore greater than 1 in any individual component Deep remission: Clinical remission (CDAI score <150) and endoscopic remission

Five most frequent AEs in participants receiving GUS were: Upper respiratory tract infection (GUS 14% vs PBO 10%)

Abdominal pain (GUS 10% vs PBO 6%)

COVID-19 (GUS 8% vs PBO 7%) Crohn's disease (GUS 6% vs PBO 20%)

Headache (GUS 6% vs PBO 4%)

AE= adverse event. DC= discontinuation. PY= participant-years. SAE= serious adverse event. SC= subcuta neo us.

^a Includes all placebo participants excluding data after a participant is rescued with guselkumab. ^b Fatal gunshot wound (non-suicidal).

Note: Participants are counted only once for any given event under specific column, regardless of the number of times they actually experienced the event.

Adverse Events of Interest Through Week 48

			Guselkumab	
Safety analysis set		Placebo ^a (N=117)	400 mg SC q4w → 100 mg SC q8w (N=115)	400 mg SC q4w → 200 mg SC q4w (N=115)
Average duration of follow-up, weeks		30.0 CERTIFICATION	47.0	48.0
Average exposure, number of administrations		7.1	6.8	11.8
AEs of special interest, n (%)		Nedi		
Active tuberculosis	25	0	0	0
Malignancies ^b	See	0	1 (0.9%)	0
Anaphylactic or serum sickness like reactions	EC PUR	0	0	0
Opportunistic infections ^c	cientill	1 (0.9%)	0	1 (0.9%)
Major adverse cardiovascular events (MACE)	diois	0	0	0

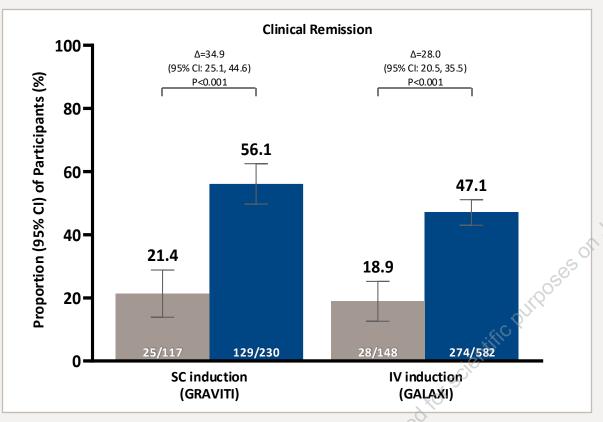

Overall, 31 of 3153 guselkumab injections (1.0%) through Week 48 had injection-site reactions

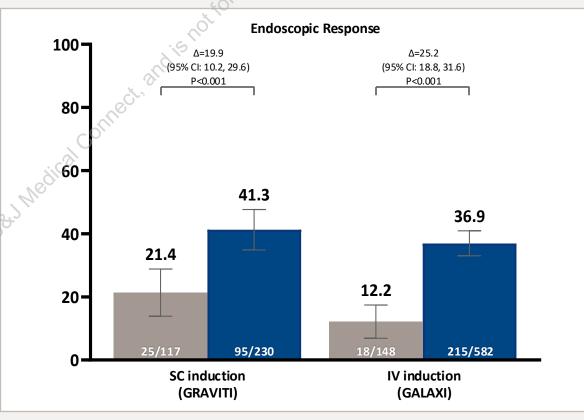

AE= adverse event. SC= subcutaneous.

Note: Participants are counted only once for any given event under specific column, regardless of the number of times they actually experienced the event. Adverse events are coded using MedDRA Version 26.0.

^a Includes all placebo participants excluding data after a participant is rescued with guselkumab. ^b Basal cell carcinoma of skin; participant continued in the study. ^c Esophageal candidiasis for the placebo participant and fungal esophagitis for the guselkumab participant.

Week 12 Outcomes with SC and IV Induction

Placebo Induction GUS Ind

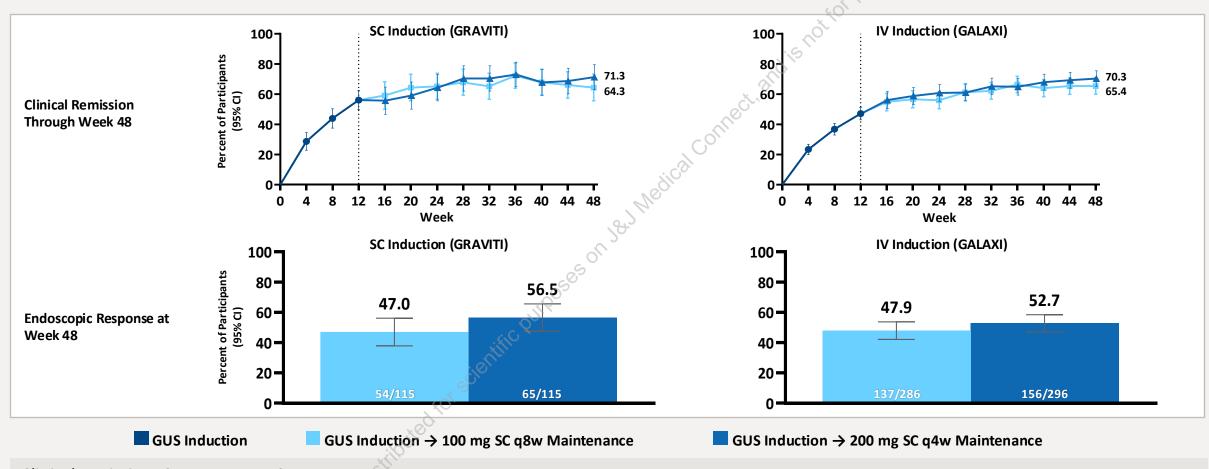

GUS Induction (400 mg SC or 200 mg IV)

Clinical remission: CDAI score <150

Endoscopic response: ≥50% improvement from baseline in SES-CD score^a

^a In GALAXI 2 and 3, endoscopic response was defined as: ≥50% improvement from baseline in SES-CD or SES-CD ≤ 2 Note: The results reported for GALAXI are from the pooled phase 3 GALAXI studies.

Week 48 Outcomes with SC and IV Induction

Clinical remission: CDAI score <150

Endoscopic response: ≥50% improvement from baseline in SES-CD score^a

a In GALAXI 2 and 3, endoscopic response was defined as: ≥50% improvement from baseline in SES-CD or SES-CD ≤ 2

Note: The results reported for GALAXI are from the pooled phase 3 GALAXI studies. In the above analyses, participants in GRAVITI treated with guselkumab who met rescue criteria at Week 16 and met the endpoint were included in order to directly compare to pooled phase 3 GALAXI (ie, identical data handling).

Key Takeaways

The GRAVITI study demonstrated that guselkumab SC induction followed by SC maintenance was superior to placebo across all multiplicity-controlled clinical and endoscopic endpoints through Week 48

Efficacy was observed in biologic-naïve participants and those with prior inadequate response or intolerance to biologics

Safety findings were consistent with the known favorable safety profile of guselkumab in approved indications and other studies in IBD

These results complement the GALAXI data¹ and demonstrate that both IV and SC induction of guselkumab are efficacious therapeutic options in CD. Furthermore, both routes of administration also demonstrated efficacy in ulcerative colitis (QUASAR² and ASTRO³ studies).
