#### Background

6	<b></b>	
6		
	C)»	

Ulcerative colitis (UC) is associated with impaired health-related quality of life (HRQoL)

Guselkumab (GUS) is a selective dual-acting interleukin (IL)-23p19 subunit inhibitor that potently blocks IL-23 and binds to CD64, a receptor on cells that produce IL-23<sup>1</sup>

GUS intravenous (IV) induction and subcutaneous (SC) maintenance was efficacious in patients with moderately to severely active UC<sup>2</sup>

GUS IV induction treatment resulted in clinically meaningful improvements in HRQoL as measured by the 29-item Patient-Reported Outcomes Measurement Information System (PROMIS-29)<sup>3</sup>

## Objective

Here, we report the effect of GUS SC maintenance therapy on HRQoL in patients who demonstrated a clinical response to GUS IV induction treatment and were randomized in the QUASAR maintenance study (NCT04033445)

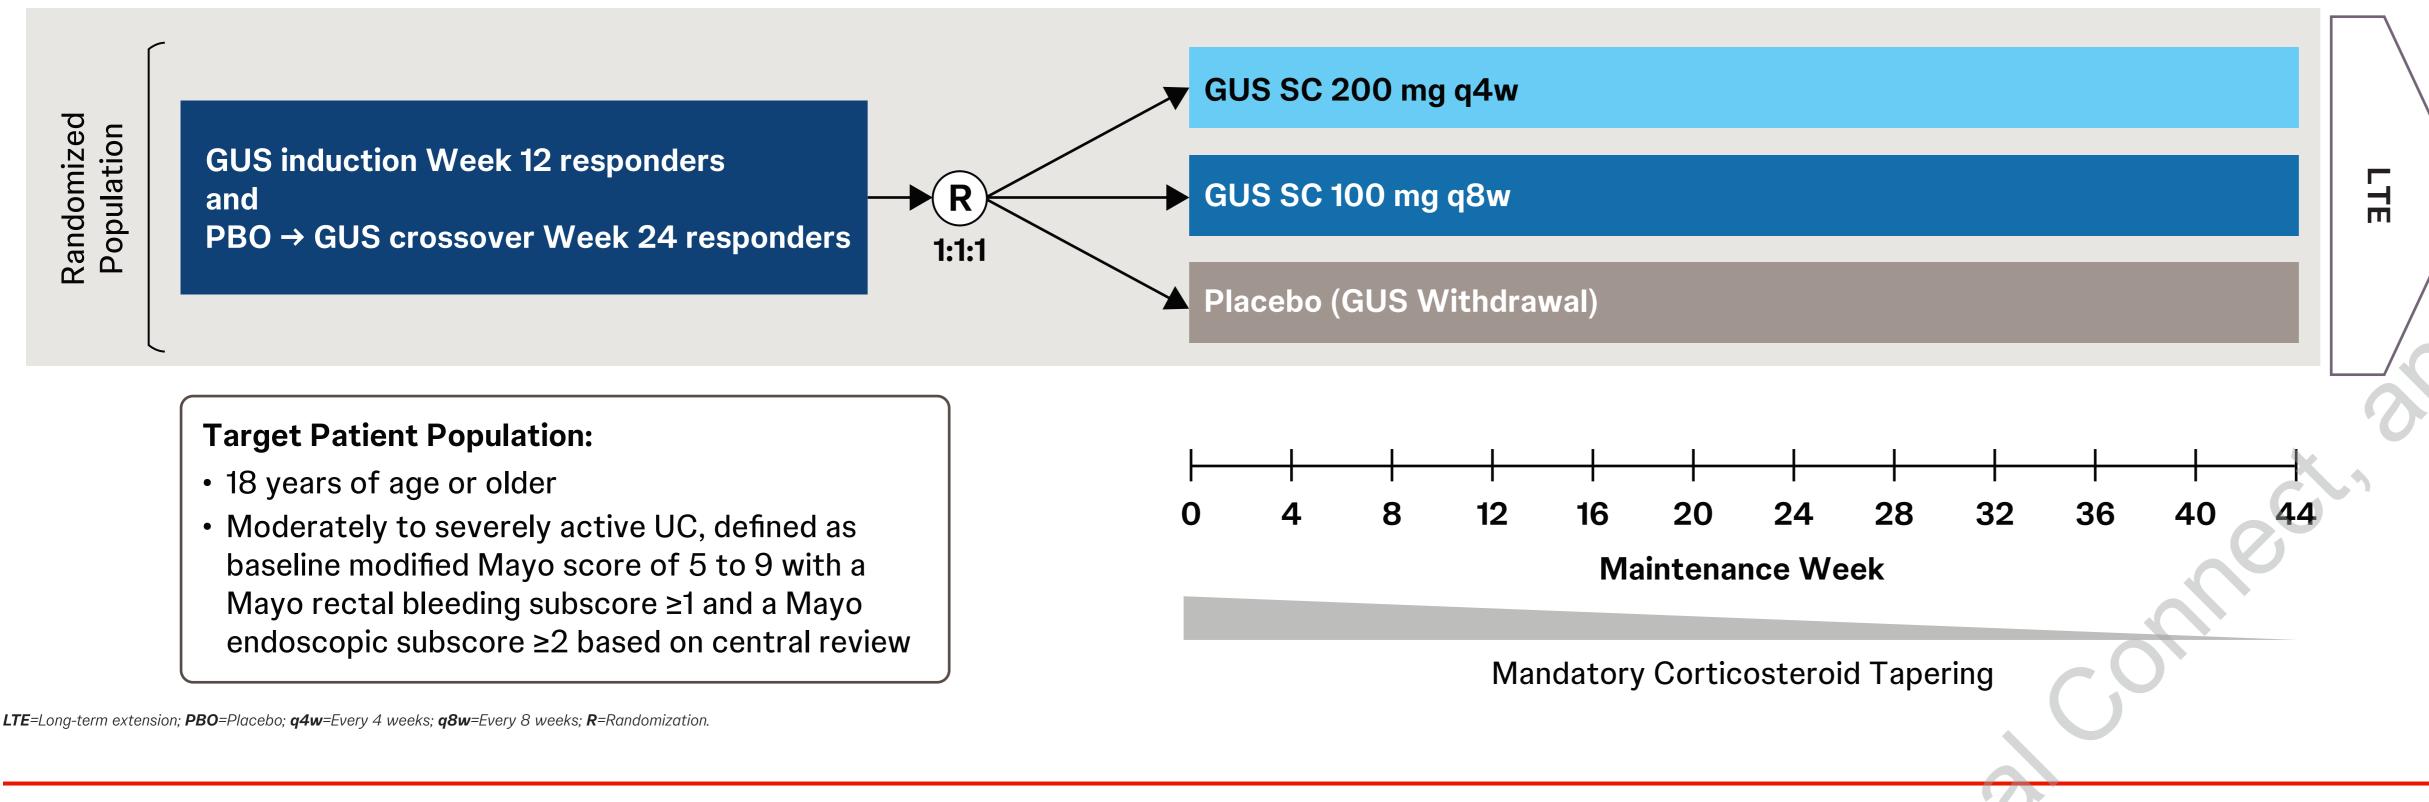

### Key Takeaways

Among patients with moderately to severely active UC who responded to **GUS IV induction, GUS SC maintenance** therapy sustained clinically meaningful improvements in HRQoL at Week 44 of the Maintenance Study as measured by the PROMIS-29, which included assessments of:

- Anxiety
- Depression
- Fatigue \_
- Pain \_\_\_\_
- interference
- Sleep disturbance
- Physical function
- Social
- participation
- Pain intensity

### **Methods**

#### Phase 3 QUASAR Maintenance Study Design Through Week 44

#### Results

Disease characteristics at induction baseline were balanced among treatment groups

**PROMIS-29** 

• The PROMIS-29 is a self-report questionnaire consisting of 7 domains (anxiety, depression, fatigue, pain interference, sleep disturbance, physical function, and social participation) and a pain intensity numeric rating scale (NRS; range 0-10)

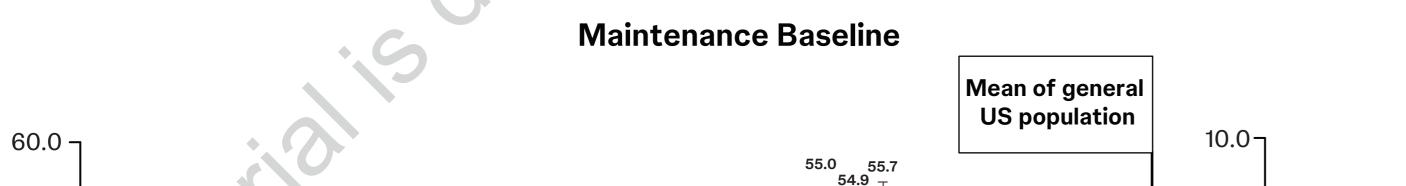

- The raw score of each domain is converted into a standardized T-score with a general population mean of 50 and standard deviation of 10
- Physical component summary (PCS) and mental component summary (MCS) scores are derived from physical and mental domain T-scores, respectively
- Depending on the domain/score, improvement of  $\geq 3$  to  $\geq 9$  points from induction baseline was identified as clinically meaningful<sup>4</sup>

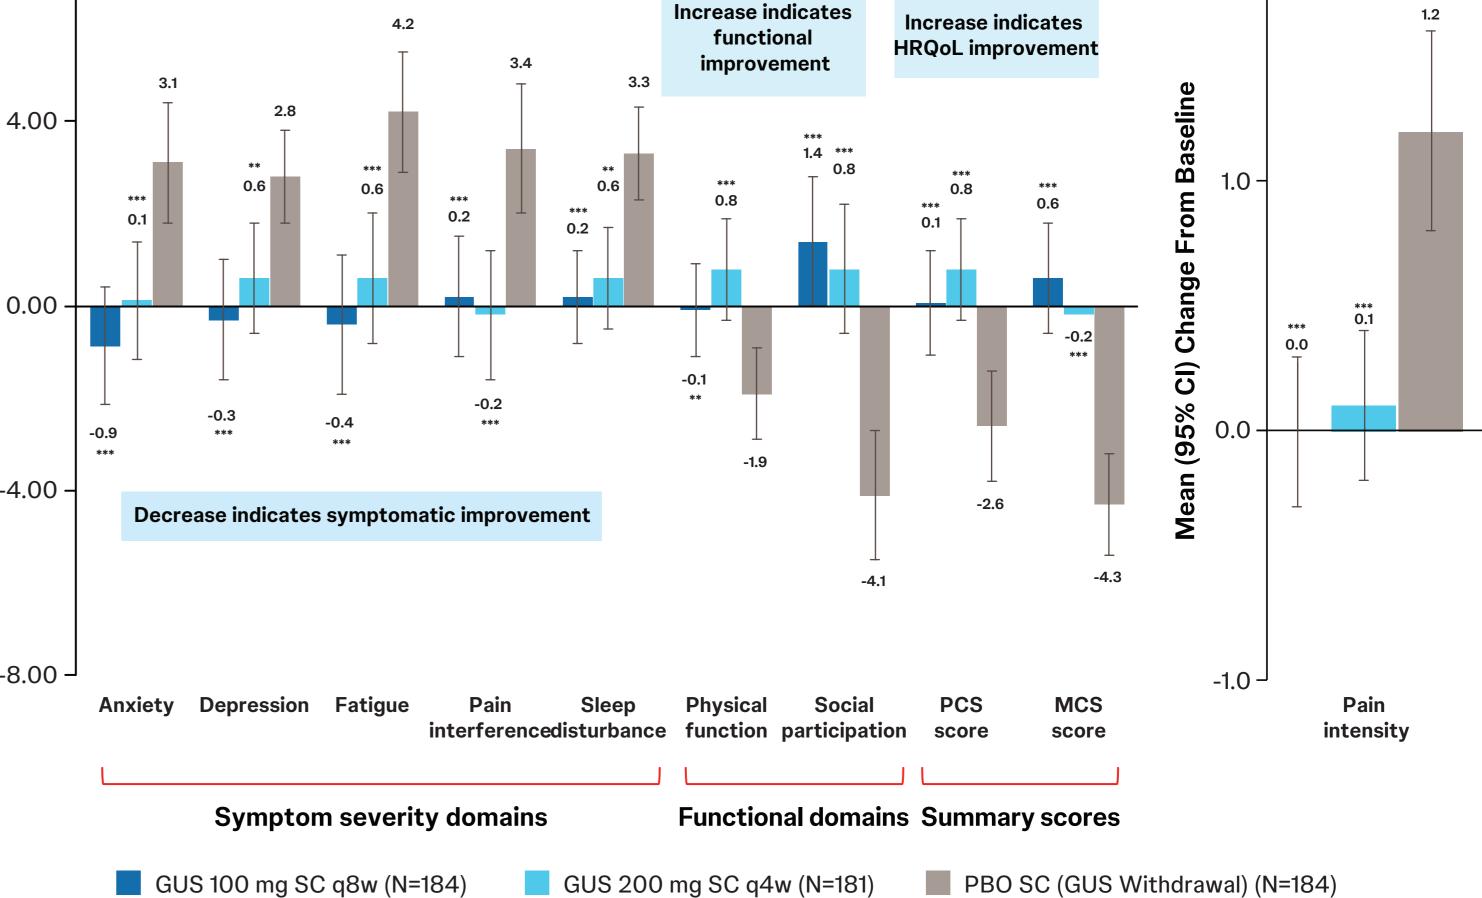

At Week 44 of the Maintenance Study, the PROMIS-29 scores observed at maintenance baseline were sustained in both GUS maintenance groups but had worsened in the PBO group

e From Baseline at Week 44 of the Maintenance Study

Data shown are mean (standard deviation) unless otherwise noted. Based on N=190 for PBO, N=185 for GUS SC 100 mg q8w, and N=187 for GUS SC 200 mg q4w. Based on N=175 for PBO, N=160 for GUS SC 100 mg q8w, and N=171 for GUS SC 200 mg q4w. °Tumor necrosis factor α antagonists, vedolizumab, and/or tofacitinib. CRP=C-reactive protein; IBDQ=Inflammatory Bowel Disease Questionnaire; IQR=interquartile range; JAK=Janus kinase.

At maintenance baseline, mean PROMIS-29 scores reflected values in line with the general population, as expected for clinical responders to GUS IV induction

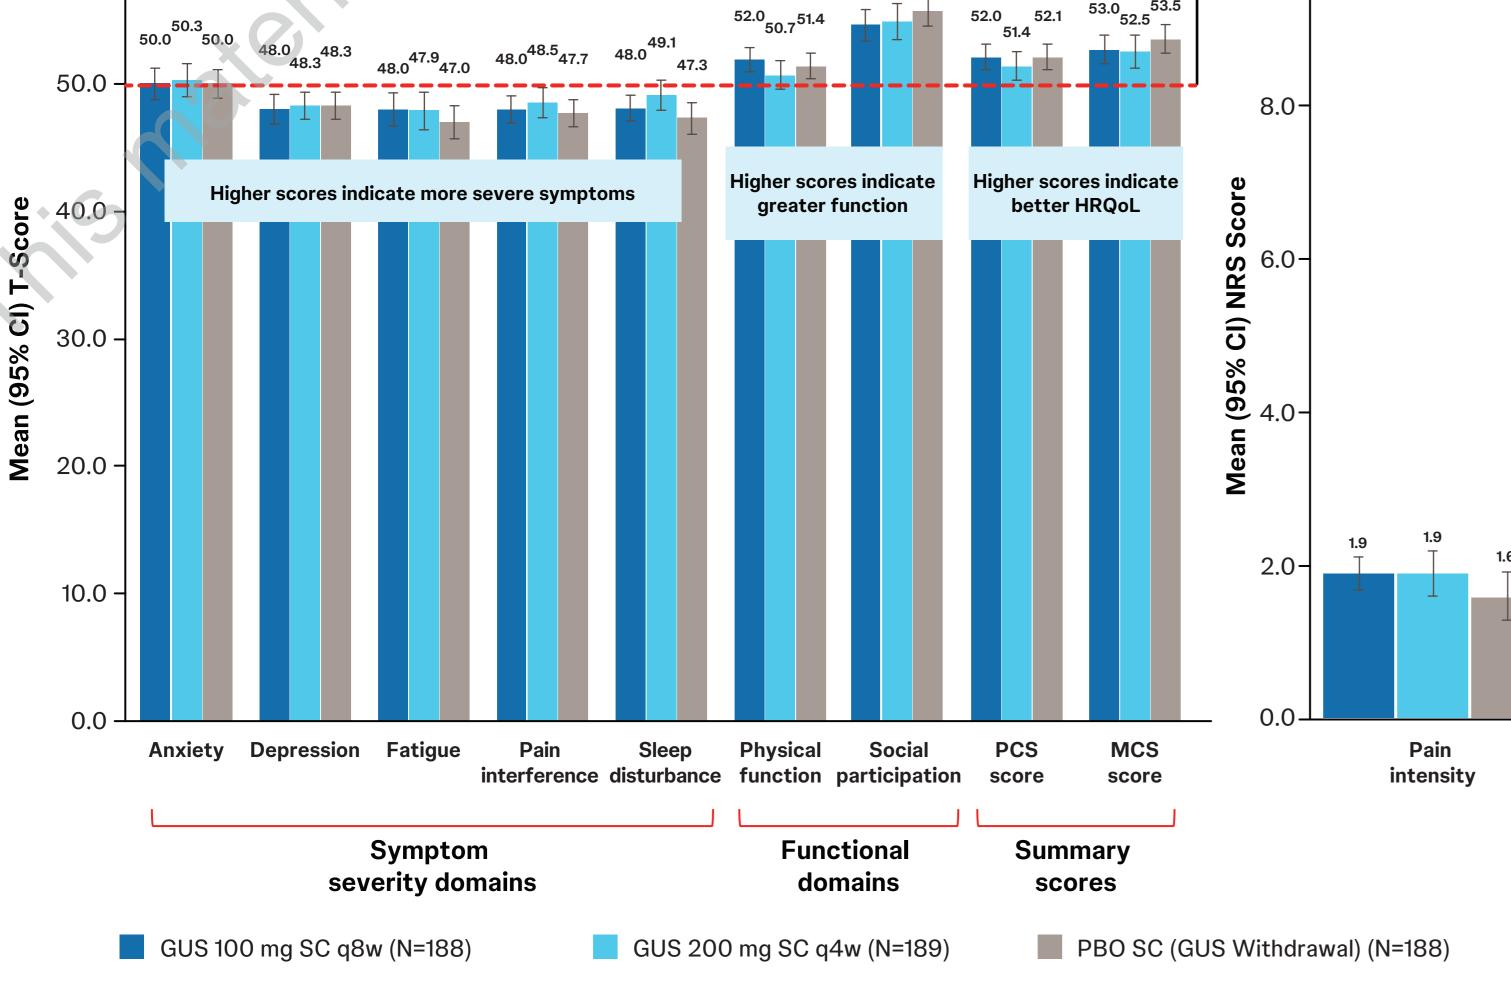

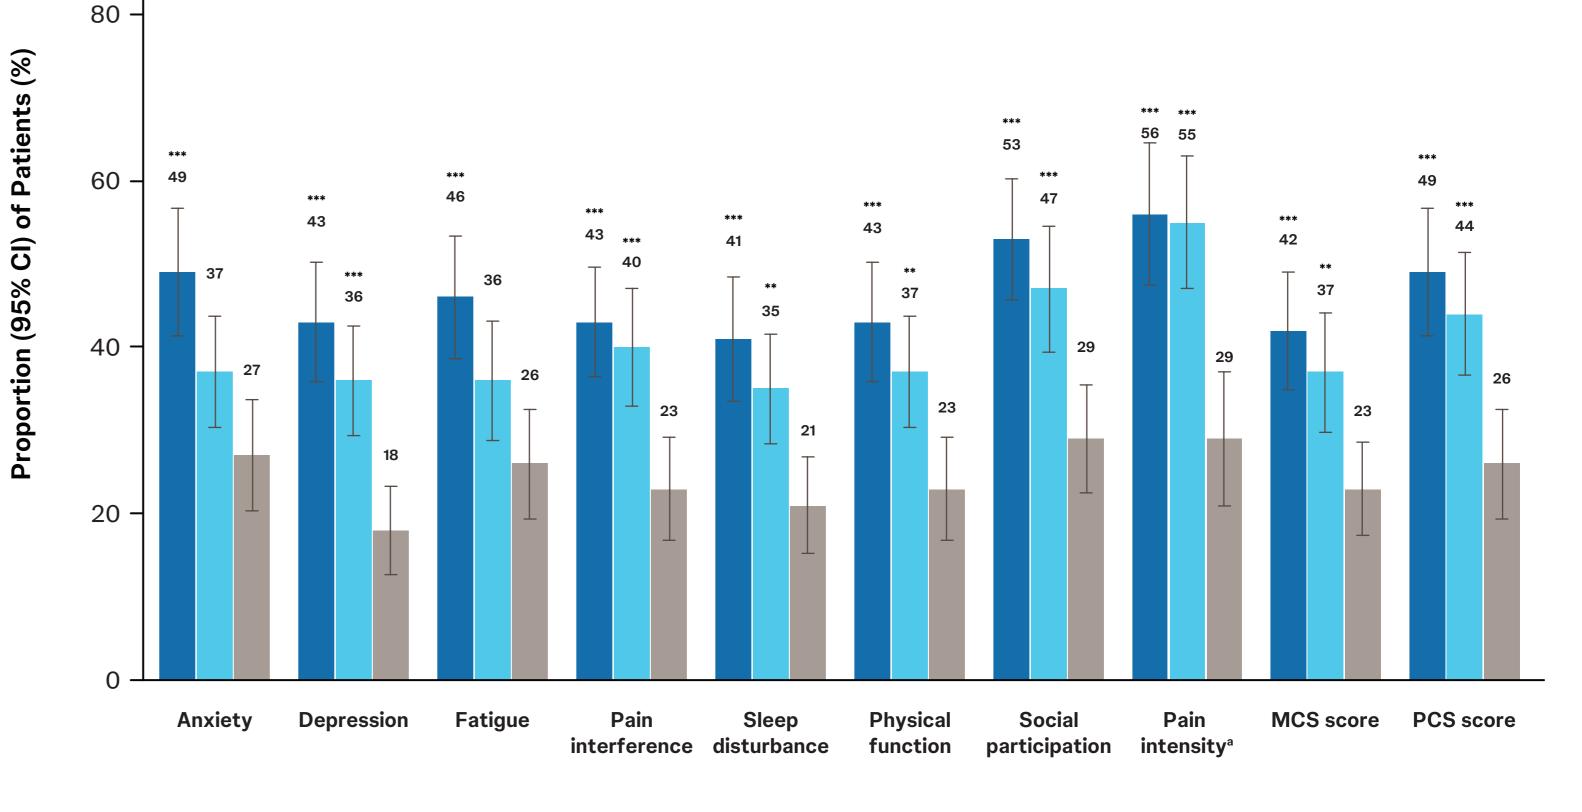

mixed-effect model repeated measures. Patients who had a prohibited change in UC medication, an ostomy or colectomy, a dose adjustment, or discontinued study other reason prior to the designated timepoint had their induction baseline value carried forward from time of event onward. For patients who discontinued study agent due agent aue to lack of efficacy, an AE of worsening of UC, of to COVID-19-related reasons (excluding COVID-19 infection) or regional crisis in Russia and Ukraine prior to the designated timepoint, observed values were used. AE=adverse event

The proportion of patients who achieved clinically meaningful improvement from induction baseline at Week 44 of the Maintenance Study was greater with GUS vs PBO for each PROMIS-29 domain T-score, pain intensity NRS score, and PCS/MCS scores

100 -

Includes only patients with modified Mayo score 5-9 at induction baseline in clinical response to GUS IV induction and randomised into the maintenance study. Cl=confidence interval; US=United States.

GUS 100 mg SC q8w (N=188) PBO SC (GUS Withdrawal) (N=190) GUS 200 mg SC q4w (N=190)

\*\* Nominal P<0.01, \*\*\* Nominal P<0.001. Includes only patients with modified Mayo score 5-9 at induction baseline in clinical response to GUS IV induction and randomised into the maintenance study. ≥3-point, ≥5-point, ≥7-point, and  $\geq$ 9-point improvement thresholds were assessed at W44 for all domains, the pain NRS, and the PCS/MCS scores. The thresholds presented here are those that most closely align with the published minimum clinically meaningful improvement value for each domain and summary score.<sup>4</sup> For pain intensity,  $\geq$ 3-point improvement from induction BL is shown; for anxiety, depression, sleep disturbance, and physical function,  $\geq$ 5-point improvement is shown; for fatigue, social participation, PCS, and MCS,  $\geq$ 7-point improvement is shown; and for pain interference,  $\geq$ 9-point improvement is shown. Patients who had a prohibited change in UC medication, an ostomy or colectomy, a dose adjustment, or discontinued study agent due to lack of efficacy or an AE of worsening of UC prior to the designated timepoint were considered nonresponders. For patients who discontinued study agent due to COVID-19 related reasons (excluding COVID-19 infection) or regional crisis in Russia and Ukraine prior to the designated timepoint, observed values were used. Patients who discontinued study agent for any other reasons prior to the designated timepoint were considered nonresponders. P-values were based on the Cochran-Mantel-Haenszel test, stratified by clinical remission status at maintenance BL (Yes/No) and induction treatment (GUS 400 mg IV, GUS 200 mg IV,  $PBO \rightarrow GUS \ 200 \ mg \ IV$ ). Pain intensity was among patients with pain intensity NRS  $\geq 3$  at induction baseline.
