

CARVYKTI® (ciltacabtagene autoleucel)

What is CARVYKTI?

What is CARVYKTI?¹

CARVYKTI is a treatment used for adult patients who have cancer of the bone marrow called multiple myeloma. It is used when at least one other treatment has not worked or stopped working

CARVYKTI is a medicine made from your own white blood cells, which have been changed (genetically modified) to recognize and attack multiple myeloma cells.

How will I receive CARVYKTI?¹

CARVYKTI is made from your own white blood cells. They are collected by a process called leukapheresis (loo-kah-fur-ee-sis).

Only your white blood cells are collected.

Your blood and its other components are returned to your body

Your white blood cells are then sent to a manufacturing center where they are genetically modified to make CARVYKTI.

Your healthcare provider will receive your dose of CARVYKTI in 1 infusion bag.

CARVYKTI® (ciltacabtagene autoleucel)

How will I receive CARVYKTI?

Treatment steps and timeline¹

Step 1

Preparation of your cells

Collection of your cells

The procedure to collect your white blood cells can take **3 to 6 hours** and may need to be repeated.

Genetic modification of your white blood cells

It takes about **4 to 5 weeks** from the time your cells are received at the manufacturing site and are ready to be shipped back to your healthcare provider, but time may vary.

Step 2

Preparation of your body

Pretreatment

While CARVYKTI is being made, you may be given **other medicines to treat the multiple myeloma**, so that it does not get worse.

Before you receive CARVYKTI, your healthcare provider will give you chemotherapy for **3 days** to prepare your body.

CARVYKTI will be administered **2 to 4 days** after receiving this chemotherapy.

Premedication

About **30 to 60 minutes** before you receive CARVYKTI, you may be given other medicines, including medicines for:

- An **allergic reaction** (anti-histamines)
- **Fever** (such as acetaminophen)

Step 3

One-time CARVYKTI infusion

Infusion duration

Your healthcare provider will give you your dose of CARVYKTI through an intravenous (IV) infusion placed into your vein at a healthcare facility.

The single infusion usually takes about **30 to 60 minutes**.

Step 4

Monitoring after infusion

Monitoring duration

You will be monitored daily for at least **7 days** after your CARVYKTI infusion.

Side effects

Your healthcare provider will:

- Check to see that your treatment is working
- Help you with any potential side effects

If you develop serious side effects, you may be hospitalized until they are under control and you can safely leave the hospital.

Blood tests

It is important that you have your blood tested to follow your progress. If you miss an appointment, call your healthcare provider as soon as possible to reschedule.
